

23rd May 2026

7:39 p.m.

I have spent this week learning about Euclidean function from Wikipedia; Euclidean algorithm to find GCD on YouTube, as well as the extended Euclidean algorithm (also on YouTube). I also watched some videos on what Sieve of Eratosthenes is in theory as well as what it looks like in the form of code. This will be used to prune the candidate keys by dividing them using the first one thousand prime numbers that is generated by my algorithm.

I spent about seven hours working on learning this week's topics.

Also, I saw on the LabTool, you said to remove my old weekly reports and push it all to GitHub. Did you mean that I delete the new "AI&ALgorithm lab continued" repository and work on the project for the rest of this term on the old repository which I used during the 3rd period?

I plan on implementing the algorithms next week and starting with unit testing already hopefully.
