

13th June 2026

7:47 p.m.

I did the peer review that was assigned to me before working on my own project. It was nice to see someone else working on RSA and their idea for the project. I edited the previous unit testing document I had (it is under the same name as the old unit testing file “unittesting.py”). I also added poetry to my GitHub as previously discussed.

I worked on this week’s stuff for about five hours.

I also had a question: I can’t remember, but was I also supposed to add a Miller-Rabin unit testing code to the unit testing document? As well, is anything else missing from my project? Since the unit testing was missing when I did it during the third term, should I delete the Testing Documentation that is uploaded on GitHub as of right now and turn in a new one?
